# Hotel Management System

## User Guide

Prepared for front desk, management, and admin use

**Login URL**
**http://localhost/hotel/login.php**

Default admin credentials:
Username: admin
Password: admin123

Tip: Use the role-specific accounts to test permissions and workflows.

# Overview

This system is a hotel management web application for monitoring rooms, customers, bookings, minibar activity, payments, and staff access.

Use it from a browser after starting Apache in XAMPP. The main login page is typically available at http://localhost/hotel/login.php

The system is designed for front-desk staff, managers, and administrators, with different access levels for each role.

# Logging In

1. Open the application in your browser.

2. Go to the login page at http://localhost/hotel/login.php

3. Enter a valid username and password.

4. Click Login.

Demo accounts:

- admin / admin123

- manager / manager123

- receptionist / reception123

- subscriber / subscriber123

Each user role controls which menu items are visible. Admins have the broadest access.

# Dashboard

After logging in, the Dashboard shows the current operational summary, including occupancy and recent activity.

Typical dashboard information includes today's bookings, payment activity, and recent operations.

Use it to quickly review what happened today and spot urgent items before opening the day's work.

# Room Management

Open Room Management to create, update, and review room records.

You can track room numbers, room type, floor, and status such as Available, Booked, Occupied, Maintenance, or Disabled.

Keep room status accurate so the booking flow and staff assignments remain reliable.

Use the room list to confirm whether a room is ready for check-in or needs maintenance.

# Bookings

The Bookings module handles guest check-in and check-out details as well as reservation flow.

## Bookings

When creating a booking, enter the guest, room, arrival date, and departure date.

The system calculates the total nights automatically and updates room status based on the booking timeline.

You can also update booking status such as Pending, Checked-In, Checked-Out, or Cancelled depending on the guest's actual status.

## Guest Payment

Use Guest Payment to record lodging charges and confirm whether a booking is paid or pending.

The payment screen typically links a booking to a room and guest, showing room charges and payment details.

Once payment is received, mark the booking as paid to keep the accounting information accurate.

This module helps front desk staff close bookings efficiently and reduce billing mismatches.

## In-Room Minibar

The minibar feature records charges for in-room items and services consumed by guests.

The system can track item categories, item names, quantity, and total value for each order.

This is useful for adding minibar charges to a guest bill without manual reconciliation.

Review the records regularly to ensure all minibar sales are included in final billing.

## Contact and Support

The Contact & Support area is used for guest or staff support requests.

Use it to manage requests, follow up on issues, and keep a visible log of support interactions.

This makes it easier for the hotel team to respond quickly and track unresolved concerns.

## Summary and Reporting

The Summary page provides a high-level report of hotel activity, bookings, and payments.

Managers and admin users can review financial trends and operational activity from one place.

Use this screen for weekly reviews, handover updates, and performance monitoring.

## Users and Access Control

The Users module is used to manage staff accounts and their roles.

Common roles include admin, manager, receptionist, and subscriber.

Each role has different access to pages such as dashboard, bookings, payments, users, and settings.

## Users and Access Control

Only authorized staff should be allowed to create or manage user accounts.

## Settings

The Settings page lets users choose the display language and color theme.

The language preference is stored in the browser, so it remains available on the same device.

The application also includes several theme options for a more personalized interface.

## Best Practices

- Update room status when rooms are cleaned, booked, or out of service.
- Check in bookings with complete guest data before finalizing stays.
- Keep payment entries current to avoid missed or duplicate billing.
- Review minibar and support records daily to catch errors early.
- Log out when leaving the workstation, especially on shared devices.

# Quick Start Checklist

1. Open http://localhost/hotel/login.php
2. Sign in using a valid staff account
3. Review the dashboard for daily activity
4. Update room availability and booking status
5. Record guest payments and minibar charges
6. Review summary reports and log out when finished
